EXPERIMENT 1

AIM: To install and configure the Flutter development environment and prepare the system for Flutter application development.

OBJECTIVE: To install the Flutter SDK, configure Android Studio and Android Emulator, and verify the Flutter environment using Flutter tools.

COURSE OUTCOME: Apply Flutter framework and Dart programming to develop cross-platform mobile applications, demonstrating proficiency in engineering fundamentals and tools.

THEORY: Flutter is an open-source UI framework developed by Google for building cross-platform applications using the Dart programming language. The Flutter development environment consists of the Flutter SDK and supporting tools required to develop, run, and test applications.

The flutter doctor command is used to check whether the required Flutter dependencies and development tools are correctly installed and configured.

Software Requirements: -

- Flutter SDK
- Android Studio
- Android SDK
- Android Emulator
- Dart SDK
- Windows operating system

Procedure: -

Step 1: Install Flutter SDK

Step 2: Install Android Studio

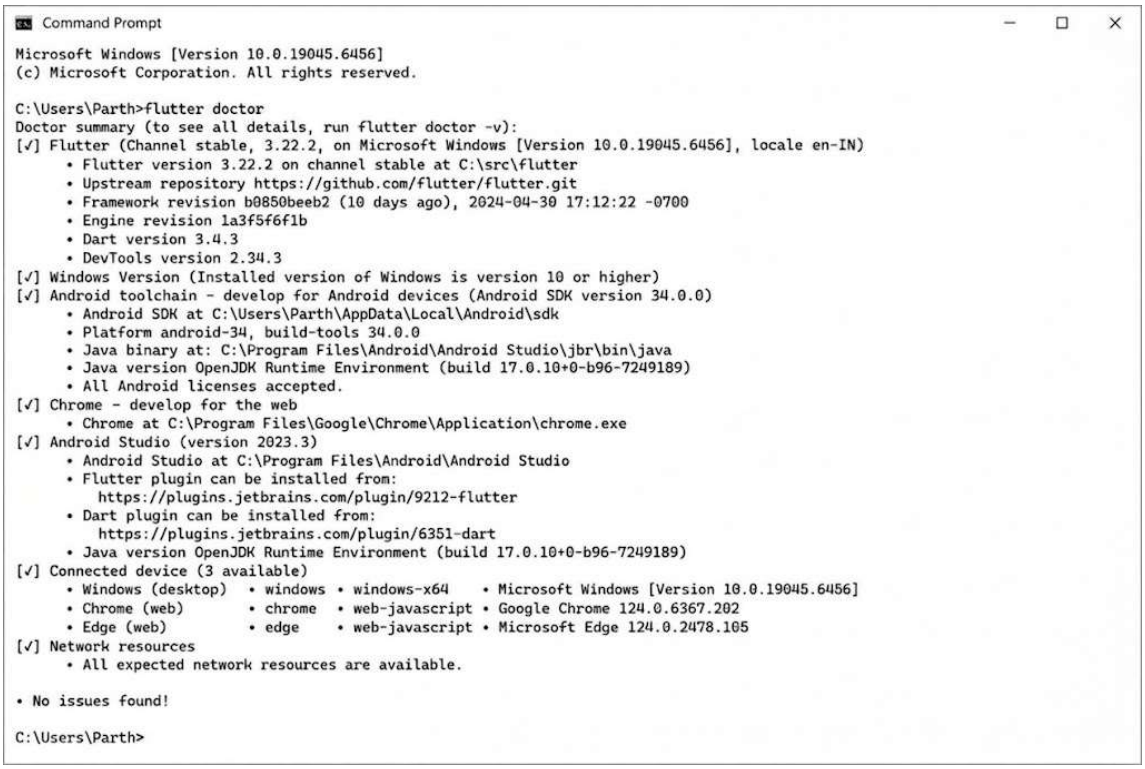

Step 3: Configure Android Emulator

Step 4: Verify Flutter Installation

Step 5: Accept Android Licenses

Step 6: Final Verification

OUTPUT:

CONCLUSION: The Flutter development environment was successfully installed and configured. The Flutter SDK, Android development tools, and required dependencies were verified successfully using the flutter doctor command. The practical helped in understanding the installation and configuration of the Flutter development environment, as well as using Flutter Doctor to check the system configuration.
