EXPERIMENT 2

AIM: To run a basic Flutter Hello World app.

OBJECTIVE: To understand the basic structure of a Flutter application and create, run, and display a simple “Hello World” application using Flutter widgets..

COURSE OUTCOME: Apply Flutter framework and Dart programming to develop cross-platform mobile applications, demonstrating proficiency in engineering fundamentals and tools.

THEORY: Flutter is a UI framework developed by Google for creating cross-platform applications using the Dart programming language. A Flutter application starts execution from the main() function, where the runApp() method launches the application.

The MaterialApp widget provides the basic structure of the application, while Scaffold provides the screen layout. The Text widget is used to display "Hello World!" on the screen.

CODE:

```
import 'package:flutter/material.dart'; void

main() => runApp(const MaterialApp(

debugShowCheckedModeBanner: false,

home: Scaffold(

  body: Center(

   child: Column(

    mainAxisAlignment: MainAxisAlignment.center,

    children: [

     Icon(Icons.flutter_dash, size: 80),

     SizedBox(height:

     20), Text(

      'Hello World! 👋',

      style: TextStyle(

      fontSize: 30,

       fontWeight: FontWeight.bold,

      ),

     ),
```

```
        SizedBox(height:
        8), Text(
          'Welcome to Flutter',
          style: TextStyle(fontSize: 16),
        ),
      ],
    ),
  ),
 ),
));
```

OUTPUT:

CONCLUSION: The basic Flutter Hello World application was successfully created and executed with an attractive user interface, displaying a welcome message using common Flutter widgets. The basic Flutter Hello World application was successfully created and executed, and the "Hello World!" message was displayed on the screen.
